

MEDASSIST-AI

Milestone 4 Report

DRUSHHTI KUHIKAR

Project Deployment

1. Project Description

MedAssist-AI is an AI-powered healthcare platform designed to assist users in analysing symptoms, predicting possible diseases, and managing healthcare-related workflows through different user roles.

The system includes multiple functionalities such as user authentication, symptom analysis, disease prediction, dashboards, patient-related workflows, appointment management, and role-based access for Administrators and Doctors.

The fourth milestone focused on the **final deployment and testing of the MedAssist-AI system**. The completed application was deployed successfully and made accessible through a live web environment. After deployment, the major system workflows, user roles, and frontend interface were tested to ensure that the application was functioning correctly.

This milestone also included improvements to the frontend user interface and overall visual presentation of the application. The updated interface was tested on both desktop and mobile devices to verify responsiveness and usability.

2. Objectives

The objectives of this milestone were:

- To successfully deploy the MedAssist-AI application.
- To make the application accessible through a live deployment.
- To test the major functionalities of the deployed system.
- To verify role-based access for Admin and Doctor users.
- To test the Admin and Doctor workflows.
- To improve the overall frontend design and visual presentation.
- To verify the responsiveness of the application on desktop and mobile devices.
- To identify and resolve any bugs or unexpected behaviour before the final presentation.

3. Final System Deployment

The MedAssist-AI application was successfully deployed and made accessible through a live web deployment. The deployment allowed the project team to access and test the application outside the local development environment.

The frontend application was deployed using Vercel. After deployment, the live application was tested to verify accessibility, navigation, authentication, and the major system functionalities.

The successful deployment represents an important stage in the development of MedAssist-AI, as the completed system can now be accessed and demonstrated through a live environment.

4. Frontend and User Interface Improvements

During this milestone, improvements were made to the overall user interface and visual design of the MedAssist-AI application. The purpose of these changes was to improve the appearance of the system and make the application more professional and suitable for presentation.

The improvements included enhancements to the background design, visual components, system-related elements, and other interface components. Additional visual elements, including 3D-style and DNA/system-related designs, were incorporated to improve the overall presentation of the application.

The updated frontend was tested on both desktop and mobile devices. Major navigation and application functionality were checked to ensure that the interface remained responsive and usable across different screen sizes.

5. System Testing and Validation

After deployment, the major workflows of the MedAssist-AI system were tested to verify that the application was functioning correctly.

5.1 Admin Module Testing

The Admin functionality was tested by logging into the Admin dashboard and checking the available features.

The following areas were verified:

- Admin login and authentication.
- Access to the Admin dashboard.
- Dashboard and analytics functionality.
- Viewing existing accounts and system data.
- Creation of additional Doctor accounts.
- Overall Admin workflow.

Predefined Admin accounts were used to test role-based access to the system.

5.2 Doctor Module Testing

The Doctor functionality was also tested using predefined Doctor accounts. The Doctor dashboard and major healthcare-related workflows were checked after deployment.

The following areas were tested:

- Doctor login and authentication.
- Access to the Doctor dashboard.
- Patient-related workflows.
- Appointment-related functionality.
- Other available Doctor features.

This testing helped verify that the Doctor role could access the appropriate functionality within the deployed system.

5.3 General Application Testing

The overall application was tested to check the major user workflows and interface functionality.

The testing included:

- Login functionality.
- Navigation between different pages and sections.
- Role-based access.
- Major Admin and Doctor workflows.
- Frontend responsiveness.
- Desktop compatibility.
- Mobile compatibility.
- Identification of bugs, errors, or unexpected behaviour.

The testing process helped ensure that the deployed application was functioning correctly and was ready for demonstration.

6. Deployment Results

The MedAssist-AI application was successfully deployed and made available through a live web environment.

The major Admin and Doctor workflows were tested after deployment. The updated frontend interface was also checked on desktop and mobile devices to verify responsiveness and usability. The deployment and testing activities confirmed that the major functionality of the application was operational and ready for the final project presentation.

7. Conclusion

The fourth milestone focused on the final deployment, frontend improvements, and system testing of the MedAssist-AI application. The application was successfully deployed and the major system workflows were tested, including Admin and Doctor functionalities. The frontend design was also improved and tested on both desktop and mobile devices.

Overall, the successful deployment and testing of the application prepared MedAssist-AI for the final project presentation and demonstration.
